

Vaave SSO Integration – Client-Side (Node.js)

This guide outlines how to integrate Vaave Single Sign-On (SSO) on the client-side using Node.js and the shared SDK.

1. Installation

Install the provided SSO SDK in your project. Here is the official [npm package link](#). You can refer to the package readme for more integration details.

```
npm install vaave-sso-sdk
```

2. Required Setup Details (To Share with Vaave)

To configure SSO for your app, please provide the following:

- **Domain**

The domain from which you will initiate the SSO request.

Example: your-app.com

- **Redirect Url**

The path where users should be redirected after login. Vaave will append a token to this URL as query params.

Example: https://your-app.com/sso/callback

3. After Setup

Once you provide the above:

- We will share a **client key** to decrypt the token.
- You will receive a **client ID** to use in your SSO requests.
